Lindemulder

1. It has been estimated (Rees and Wackernagel) that it would take the land area of five additional planet earths to meet the consumption of the people now on earth if they all consumed at the level of the United States. Discuss what the implications are of this statistic and any solutions that you see.

2. As China and India become developed nations, their combined populations of nearly 3 billion people will be approximately 10 times more than that of the United States. As their per capita ecological footprint nears that of the United States, competition for resources will become more intense. What, if anything, should the developed countries of today do to lessen or avoid potential conflicts in the future?

3. The people of the United States are often said to have more of an impact on the environment than the citizens of other countries. Using the concepts of GDP and PPP explain why that is true.
